List of Table and Figures

Table S1 SST boundary conditions for the CAM4 experiments

Figure S1 Differences between experiments EXP2 and EXP1 in (a) SST (unit: °C), (b) SLP (unit: hPa), (c) 850-hPa wind fields (UV850) (unit: m s⁻¹), (d) Z500 (unit: m) and (e) 200-hPa zonal wind (U200) (unit: m s⁻¹). (f-j) Same as (a-e) but for differences between experiments EXP4 and EXP1. Areas exceeding 95% confidence level are dotted except for UV850 (shaded).

Figure S2 Differences between experiments EXP3 and EXP1 in (a) SST (unit: °C), (b) SLP (unit: hPa), (c) UV850 (unit: m s⁻¹), (d) Z500 (unit: m) and (e) U200 (unit: m s⁻¹). (f-j) Same as (a-e) but for differences between experiments EXP5 and EXP1. Areas exceeding 95% confidence level are dotted except for UV850 (shaded).

Figure S3 The winter AO (red) and EAWM (black) indices in the observation. The AO index is from the NOAA/ESRL website (https://www.esrl.noaa.gov/psd/data/20thC_Rean/timeseries/monthly/AO/). The EAWM index is calculated from the Twentieth Century Reanalysis version 2 (20CR
V2) data. Both of the two indices are 9-year running mean values.

**Figure S4** The correlation coefficient between the winter AO and EAWM index for the period of 1870−2004 in the historical simulations of CMIP5 models (the 9-year low-pass filter is employed on the all indices). The symbols indicate the significance level.

**Figure S5** The winter PDO (red) and EAWM (black) indices in the observation. The PDO index is from the website (http://research.jisao.washington.edu/pdo/PDO.latest.txt). The EAWM index is calculated from the Twentieth Century Reanalysis version 2 (20CR V2) data. Both of the two indices are 9-year running mean values.

**Figure S6** The winter (a) AO (multiplied by -1; red) and EAWM (black), (b) PDO (red) and EAWM (black) indices from the 500-year piControl simulation in the GFDL-ESM2M model (the 9-year low-pass filter is employed on the all indices).
